Sage PrimoFit™

External Urine Management
for the Male Anatomy

Date: _____
Time: _____
Staff Initials: _____

Stays in place

Sure-Stay Silicone Adhesive Pad and Base Adhesive keeps device in place and allows for easy application and removal

Customizable fit

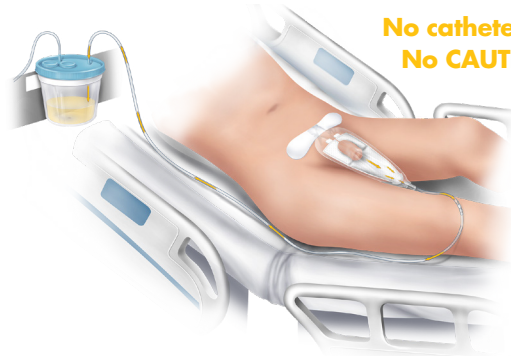

Base Adhesive eliminates need to use sizing charts and promotes process efficiency

Helps keep skin dry

Ultra-soft wicking fabric diverts urine away from the skin

Can be left in place for up to 24 hours

No catheter.
No CAUTI.™

Easy connection

Tiered Suction Tubing Adapter allows for easy connection to hospital suction tubing

A breakthrough

in male urine management

This external system, the first-of-its-kind to feature continuous suction, is designed to help manage and promote early catheter removal, addressing the #1 risk factor of catheter-associated urinary tract infection (CAUTI).¹ While transitioning patients to independent continence, PrimoFit serves as an alternative to external collection devices or, when appropriate, indwelling catheters.

PrimoFit's ultra-soft wicking fabric diverts urine away from the patient's skin. Urine is then diverted through the wicking chamber and suctioned into a canister, helping keep the skin dry and addressing a risk factor of incontinence-associated dermatitis (IAD).

Approximately

75%

of hospital-acquired UTIs are associated with an indwelling urinary catheter.¹
